1969 / 1970

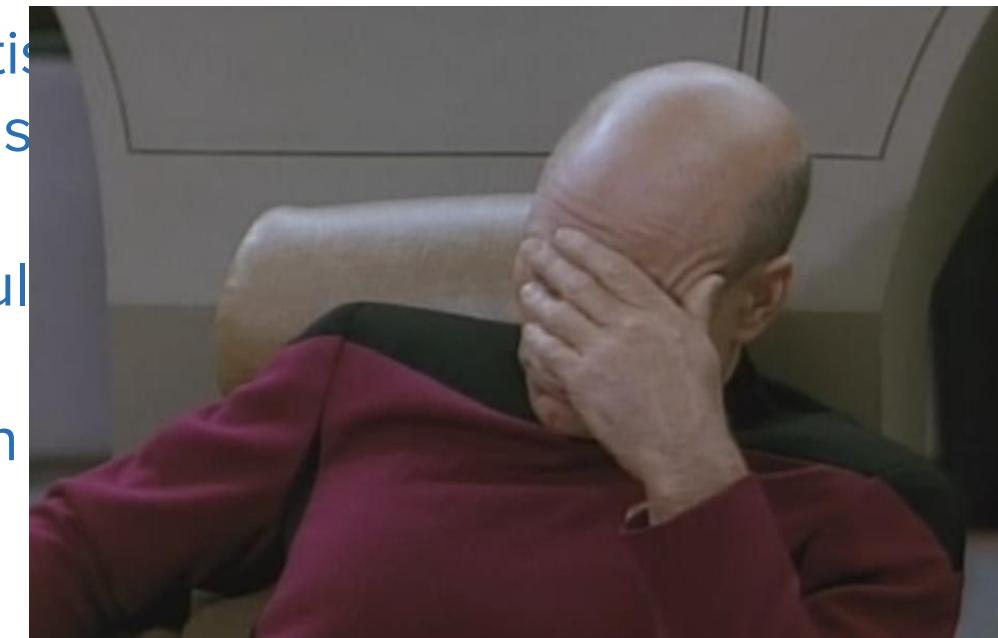

Some not great definitions

- Data science = statistics
- Data science = computer science
- Data science = machine learning
- Data science = statistics + computer science + machine learning
- Data scientists are big data wranglers
- “A data scientist is just a sexier word for statistician.” –Nate Silver
- “A data scientist is a better computer scientist than a statistician and is a better statistician than a computer scientist.”
- “A data scientist is a statistician who is useful” – Hadley Wickham
- A data scientist is a good statistical analyst
- A data scientist is a statistician who codes in python

Some not great definitions

Why these definitions are bad

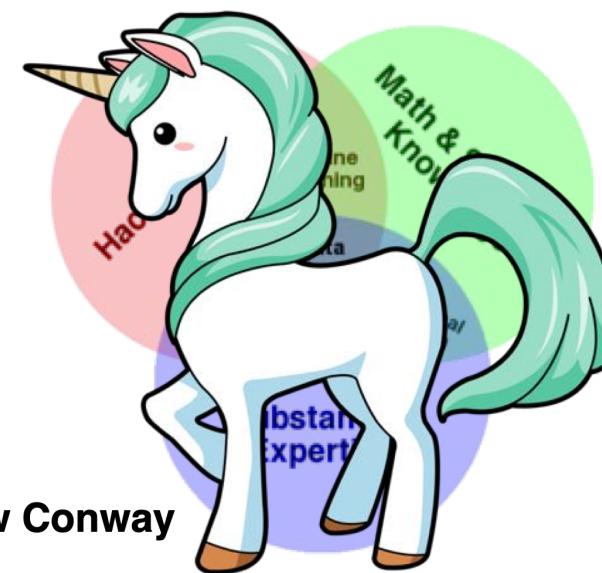

- “Data science is just ...” definitions miss the point
 - If data science is just statistics (or machine learning, or computer science, or engineering) we wouldn’t need a new term, let alone a new discipline
 - The popularity of “data science” suggests that there’s a newly recognized need
- “A data scientist is a good ” whatever definitions aren’t helpful
 - They’re almost deliberately judgmental
 - A good definition doesn’t depend on opinions
 - There are “data scientists” in each discipline, but some very good statisticians / computer scientists / etc aren’t “data scientists”

Why these definitions are bad

- “Data science is the combination of these 40 skills ...” are unrealistic

The Data Scientist Archetype

Why these definitions are good

- Kinda like the blind men and the elephant – no one perspective is completely right or completely wrong, but piling them all up isn't right either
- They give a sense of what is valued by the data science community – using data in a principled way and coding well

Why these definitions are good

- Data science is interdisciplinary
 - You do need a breadth of skills
 - You also need a particular mindset – curiosity and engagement is critical
 - You need some domain knowledge to be successful

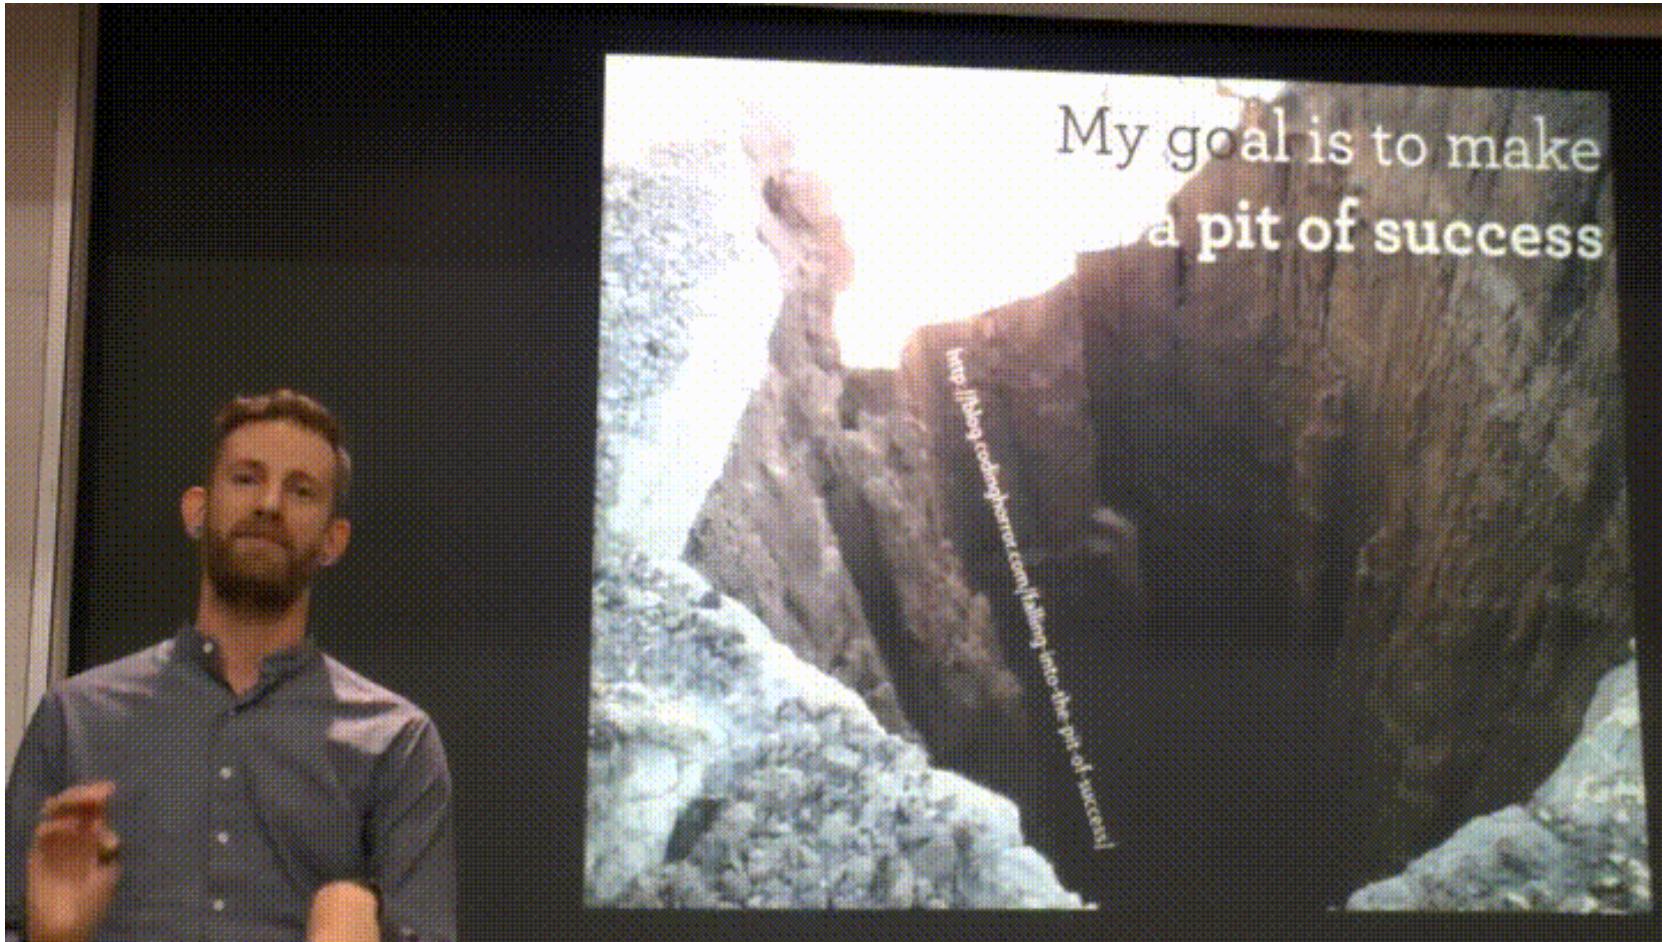

<https://www.xkcd.com/1831/>

For the purpose of this class:

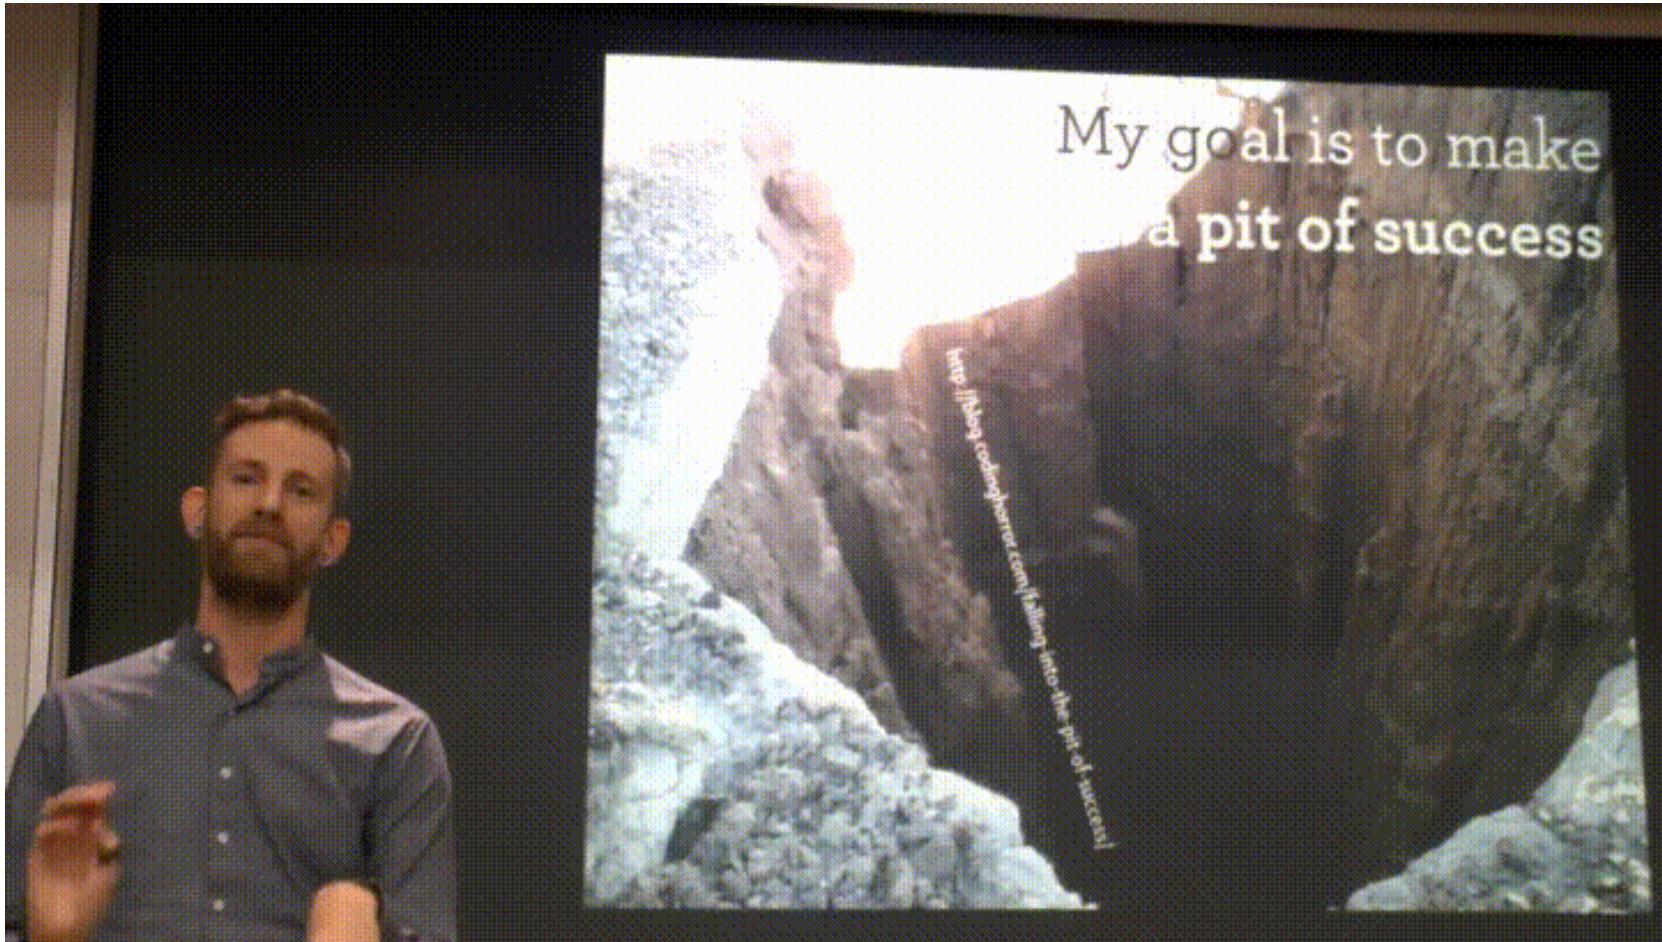

Data science is the study of formulating and rigorously answering questions using a data-centric process that emphasizes clarity, reproducibility, effective communication, and ethical practices.

- We'll focus mostly on process; how to formulate and answer questions through analyses are the focus of other courses
- This is also a “bad” definition, in that it doesn’t explain where data science came from

ISI 2017

ISI 2017

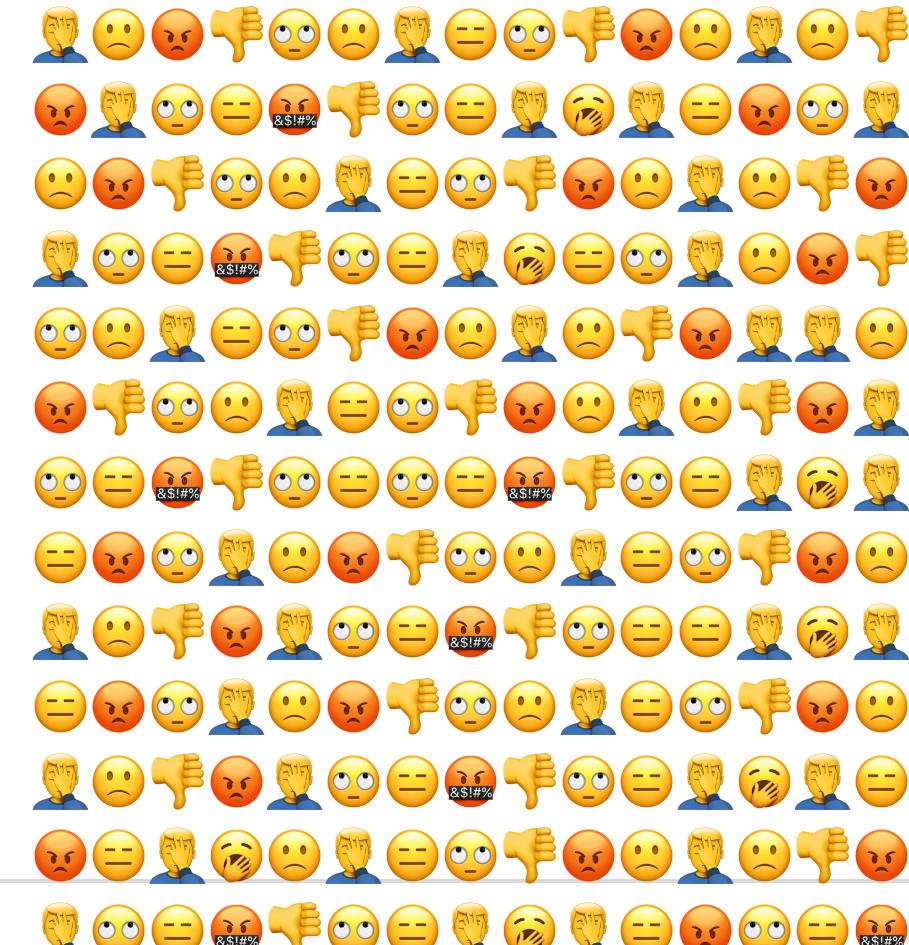

First question from the audience

“What is the point of ‘data science’? Aren’t we **already** data scientists?”

First question from the audience

“What is the point of ‘data science’? Aren’t we **already** data scientists?”

Response from Hadley Wickham (roughly)

“A data scientist is a statistician who’s useful”

Response from Hadley Wickham (roughly)

“A data scientist is a statistician who’s useful”

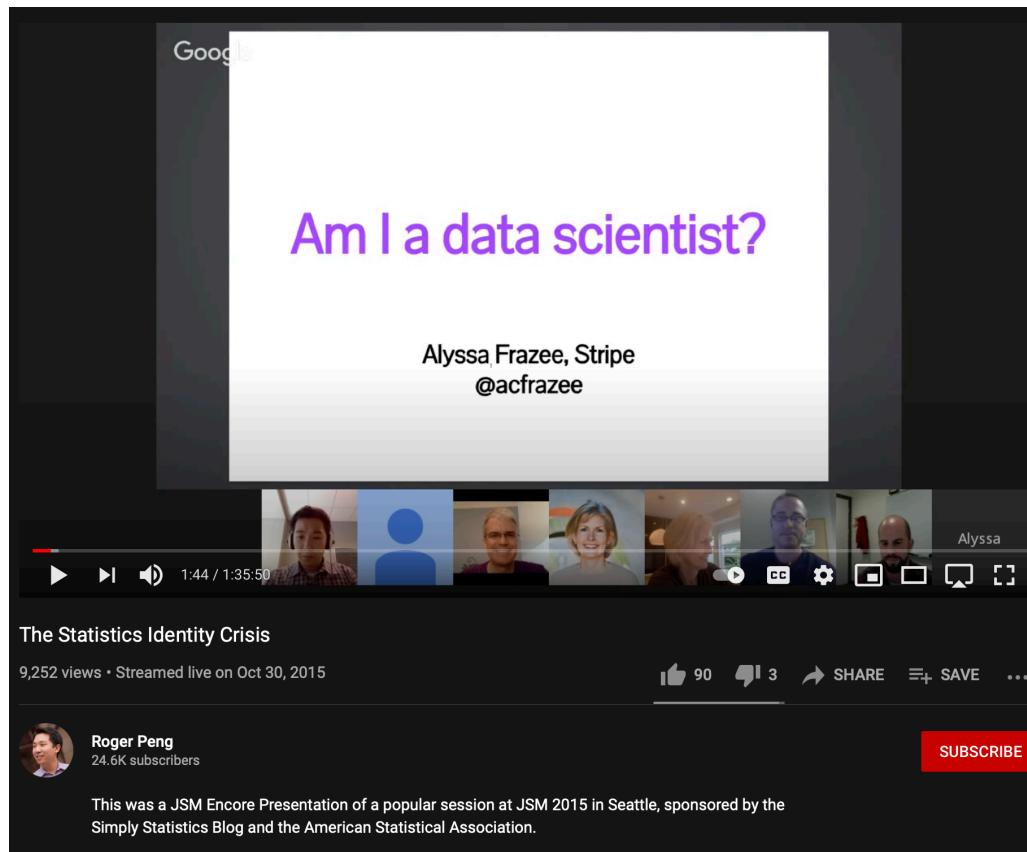

That question is understandable

- It's easy, in 2021, to forget what the statistical identity crisis phase was like
- But that was a whole thing, for quite a while

That question is understandable

- It's easy, in 2021, to forget what the statistical identity crisis phase was like
- But that was a whole thing, for quite a while

What made “data science” happen

- Data science emerged in parallel to (at least) six broad trends:
 - Big data
 - Emphasis on prediction
 - Reproducibility crisis in science
 - Interdisciplinary research
 - Diversity, equity, and inclusion
 - Everything should be on the internet
- These weren’t new in 2012 and aren’t unique to data science
- ... but they had a big impact on the “data science” perspective

Connotation >> definition

- Core data science values aren't built into the definition, but were critical to the valence of "data science"

Public Health Data Science

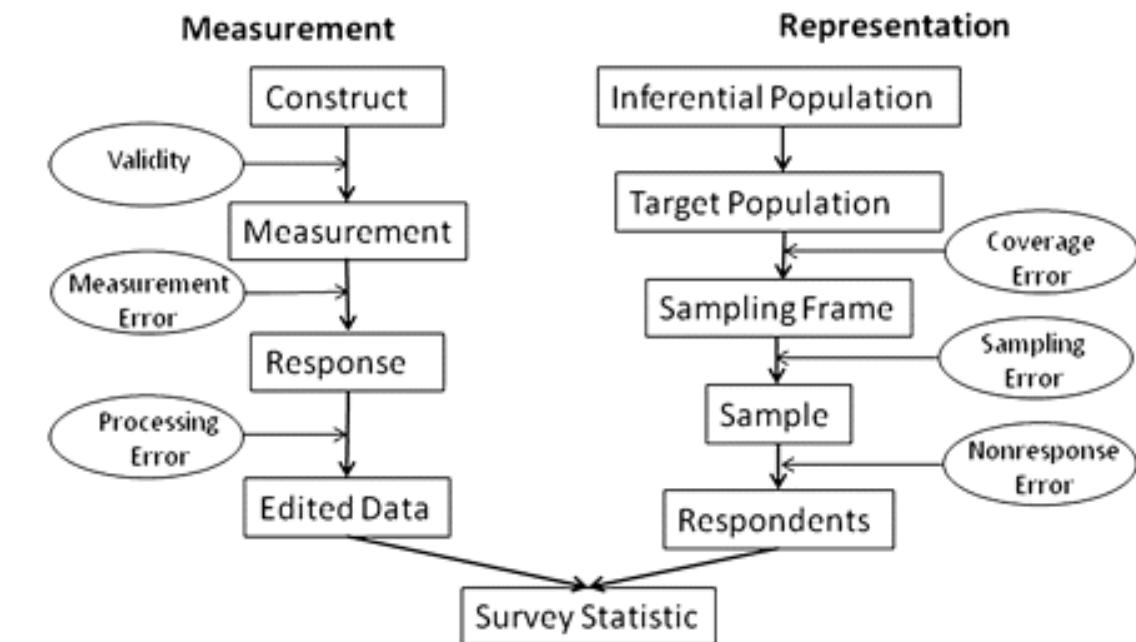

[Public health] data science is the study of formulating and rigorously answering questions [in order to advance health and well-being] using a data-centric process that emphasizes clarity, reproducibility, effective communication, and ethical practices.

“Public Health” is the important part

- Public health training emphasizes some elements that are critical data science thinking and work:
 - Study design
 - Sampling process
 - Measurement process
 - Desire vs ability to infer causation
 - Cross-disciplinary collaboration
 - Engagement with data ethics
 - Public dissemination and dialog

“Public Health” is the important part

- Public health training emphasizes some elements that are critical data science thinking and work:
 - Study design
 - Sampling process
 - Measurement process
 - Desire vs ability to infer causation
 - Cross-disciplinary collaboration
 - Engagement with data ethics
 - Public dissemination and dialog

How to learn data science

- Build a broad knowledge base
- Don't be embarrassed by what you don't know
 - Corollary: don't be a jerk to people who don't know what you know
- Ask questions (well) and keep learning

- Pretty much the same as learning anything, but hard because people don't like to show their code

How to learn data science

- Build a broad knowledge base
 - Don't be embarrassed by what you don't know
 - Corollary: don't be a jerk to people who do know
 - Ask questions (well) and keep learning
-
- Pretty much the same as learning anything else, except that people tend to like to show their code

“Sucking at something is the first step to becoming sorta good at something”

-Jake The Dog

don't like

How to learn data science

- All questions are good questions, but sometimes good questions aren't asked well
- Think through what you're trying to ask
- If your code is broken, create a simple example that illustrates what's broken

David Robinson @drob · May 19

Most coders won't answer a question without testing it. So if you don't give a reproducible example, you're asking them to make one for you

Real talk about AI (as part of data science)

Daniela Witten
@daniela_witten

"When we raise money it's AI, when we hire it's machine learning, and when we do the work it's logistic regression."

(I'm not sure who came up with this but it's a gem 💎)

2:50 PM · Sep 26, 2019 · [Twitter Web App](#)

Reproducibility

- One concrete emphasis of data science is reproducibility
- Given the same data and the same code, anyone should be able to produce the same results
 - Code is an important means of communication
 - New tools encourage reproducibility, but the concept is not platform-dependent

Sharing code

- Openness is valuable – identify errors early and fix them quickly
- Try to think of sharing code as a gesture of confidence and humility
 - You've done your best, and you should feel good about that
 - Everyone makes mistakes sometimes; when you do, that's fine – fix it and move on
- Lack of transparency can reflect a lot of things
- Of these, arrogance is the most dangerous

Choosing data science tools

Choosing data science tools

Time to code!!
